Remarks on the uncertainty principle
from a mathematical point of view

Resumen:

I'll review some recent work done in collaboration with L. Escauriaza, C. Koenig and G. Ponce on some classical uncertainty principles in Mathematical Analysis as the ones due to Hardy and Morgan, and those that follow from Paley-Wiener theory.

We propose a new approach that makes no use of complex variable techniques and that is based on proving logarithmic convex inequalities for some appropriate quantities related either to solutions of the free Schrödinger Equation or to the Heat Equation. This new approach is flexible enough to be applied to non-regular hamiltonians.
